

**AMENDMENT TO THE CLAIMS:**

The following claim set replaces all prior versions, and listings, of claims in the application:

1. (currently amended) A graft copolymer composition to be blended with an olefin thermoplastic resin, the graft copolymer composition comprising:  
a lubricant selected from the group consisting of erucic amide, ethylene-bis-oleic amide and an alkylene oxide derivative, for improving scratch resistance and abrasion resistance of the olefin thermoplastic resin, wherein the amount of the lubricant is 10 to 40% by weight in the graft copolymer composition; and  
a graft copolymer as the main component, the graft copolymer having a multi-phase structure in which particles of a first polymer segment are dispersed in a second polymer segment, with the diameter of the particles being 0.001 to 10  $\mu\text{m}$ , wherein:  
the first polymer segment is one of an olefin polymer segment (a) and a vinyl polymer segment (b), while the second polymer segment is the other one of the olefin polymer segment (a) and the vinyl polymer segment (b), and the vinyl polymer segment (b) is formed from at least one of vinyl monomer selected from the group consisting of (meth) acrylic acid, (meth)acrylic alkyl ester, glycidyl (meth)acrylate and hydroxyl group-containing vinyl monomers.
2. (canceled)
3. (previously presented) The graft copolymer composition according to claim 1, wherein the graft copolymer is obtained by:  
suspending an olefin polymer in water to prepare a suspension containing particles of the olefin polymer;

adding a solution containing a vinyl monomer, a radical polymerizable organic peroxide and a radical polymerization initiator to the suspension;  
immersing the vinyl monomer, radical polymerizable organic peroxide and radical polymerization initiator in the particles of the olefin polymer;  
copolymerizing the vinyl monomer and the radical polymerizable organic peroxide within the particles of the olefin polymer to synthesize a precursor; and  
melting and mixing the precursor.

4. (original) The graft copolymer composition according to claim 3, wherein the melting of the precursor is carried out at 120 to 250°C.
5. (currently amended) A thermoplastic resin composition comprising:  
an olefin thermoplastic resin as the main components; and  
a graft copolymer composition, wherein said graft copolymer composition contains:  
a lubricant selected from the group consisting of erucic amide, ethylene-bis-oleic amide and an alkylene oxide derivative, for improving scratch resistance and abrasion resistance of the olefin thermoplastic resin, wherein the amount of the lubricant is 1 to 8% by weight in the thermoplastic resin composition; and  
a graft copolymer as the main component, the graft copolymer having a multi-phase structure in which particles of a first polymer segment are dispersed in a second polymer segment, with the diameter of the particles being 0.001 to 10  $\mu\text{m}$ , wherein:  
the first polymer segment is one of an olefin polymer segment (a) or a vinyl polymer segment (b), while the second polymer segment is the other one of the olefin polymer segment (a) and the vinyl polymer segment (b), and the vinyl polymer segment (b) is formed from at least one of vinyl

monomer selected from the group consisting of (meth)acrylic acid, (meth)acrylic alkyl ester, glycidyl (meth)acrylate and hydroxyl group-containing vinyl monomers.

6.-9. (canceled)

10. (currently amended) A molding made from a thermoplastic resin composition, wherein the thermoplastic resin composition contains an olefin thermoplastic resin as the main component and a graft copolymer composition, wherein the graft copolymer composition contains:

a lubricant selected from the group consisting of erucic amide, ethylene-bis-oleic amide and an alkylene oxide derivative, for improving scratch resistance and abrasion resistance of the olefin thermoplastic resin, wherein the amount of the lubricant is 1 to 8% by weight in the thermoplastic resin composition; and

a graft copolymer as the main component, the graft copolymer having a multi-phase structure in which particles of a first polymer segment are dispersed in a second polymer segment, with the diameter of the particles being 0.001 to 10  $\mu\text{m}$ , wherein the first polymer segment is one of an olefin polymer segment (a) and a vinyl polymer segment (b), while the second polymer segment is the other one of the olefin polymer segment (a) and the vinyl polymer segment (b), and wherein the vinyl polymer segment (b) is formed from at least one of vinyl monomer selected from the group consisting of (meth)acrylic acid, (meth)acrylic alkyl ester, glycidyl (meth)acrylate and hydroxyl group-containing vinyl monomers.

11.-13. (canceled)

14. (currently amended) The graft copolymer composition according to claim 1, wherein the graft copolymer is obtained by:  
suspending an olefin polymer in water to prepare a suspension containing particles of the olefin polymer;  
adding a solution containing a vinyl monomer, a radical polymerizable organic peroxide and a radical polymerization initiator to the suspension;  
immersing the vinyl monomer, radical polymerizable organic peroxide and radical polymerization initiator in the particles of the olefin polymer;  
copolymerizing the vinyl monomer and the radical polymerizable organic peroxide within the particles of the olefin polymer to synthesize a precursor; and  
melting and mixing the precursor.
15. (previously presented) The graft copolymer composition according to claim 14, wherein the melting of the precursor is carried out at 120 to 250°C.
16. (previously presented) The graft copolymer composition according to claim 1, wherein the lubricant is an alkylene oxide derivative having a weight average molecular weight of 100 to 100,000.
17. (previously presented) The graft copolymer composition according to claim 1, wherein the alkylene oxide derivative is at least one of polyethylene glycol, polyethylene glycol monomethyl ether and polypropylene glycol.
18. (previously presented) The thermoplastic resin composition according to claim 5, wherein the lubricant is an alkylene oxide derivative having a weight average molecular weight of 100 to 100,000.

19. (previously presented) The thermoplastic resin composition according to claim 5, wherein the alkylene oxide derivative is at least one of polyethylene glycol, polyethylene glycol, monomethyl ether and polypropylene glycol.
20. (previously presented) The molding according to claim 10, wherein the lubricant is an alkylene oxide derivative having a weight average molecular weight of 100 to 100,000.
21. (previously presented) The molding according to claim 10, wherein the alkylene oxide derivative is at least one of polyethylene glycol, polyethylene glycol monomethyl ether and polypropylene glycol.
